Resources for Discord.py to get started

- [Discord.py Documentation](#)
    - Probably the best place to get started
- StackOverflow
    - You should already be familiar, but this a lot of really great examples on how other people have designed their bot.
- [This GitHub Repo](#)
    - This Repo has a bunch of really great examples, I haven't checked most out but I'm sure there is some helpful information here.
- Source Code
    - Try looking at the bot.py on GitHub and try understanding what's going on there. Nothing too complicated, but a lot of discord.py specific things that you should get familiar with. Code is heavily commented, I tried to make it as informative and understandable as possible.
- Any AI
    - Try not to use too much AI, at least with ChatGPT, most of it has been unusable. But if you're really stuck, go for it just double check it's work and make sure you understand what's happening.

Working with tools like these means reading a bunch of documentation to understand what's going on.

I'll have more information soon as to the specific implementation with some of the commands, as far as I know we will probably be working with AWS as well (I have no experience with this so if you do that's great).
